

# Potatoes

National  
Agricultural  
Statistics  
Service

United States  
Department of  
Agriculture

Washington, D.C.

Released September 24, 1992, by the Agricultural Statistics Board.

## Acreage Up Slightly, Production Record High Value Falls 16 Percent

Acreage of potatoes harvested in 1991 totalled 1.37 million, up slightly from the previous year and 7 percent above 1989. The volume of potatoes sold was a record high 379 million cwt, up 3 percent from 1990 and 12 percent above 1989.

Yield per acre averaged a record high 304 cwt, up 11 cwt from 1990 and 15 cwt above 1989.

Production totaled 418 million cwt in 1991, an increase of 4 percent from the previous year and 13 percent above two years ago.

Utilization placed 226 million cwt of potatoes in the hands of processors, 128 million cwt was sold for fresh market, 26.7 million cwt was used for seed, 4.64 million cwt was fed to livestock or used for food on farms where grown, and 32.4 million was lost from shrinkage, dumping, and sorting loss.

Value of the 1991 potato crop fell to a five-year low of \$2.04 billion, down 16 percent from a year earlier and 25 percent below two years ago. Record high production lowered prices to an average of \$4.96 per cwt compared with \$6.08 in 1990 and \$7.36 in 1989.

## Potatoes

This publication presents final 1991 estimates of acreage, yield per acre, production, farm disposition, season average price, value, and utilization of sales including processing with historic comparisons. First of the month (December through May) stocks of potatoes for the 15 major fall producing States are also included. Production, disposition, and value data for Alaska are shown separately.

These final estimates are based on information furnished by crop reporters, processors, and cooperating State or Federal Agencies. The various sources include: Market News Service rail and truck shipments and unloads, Federal-State inspections--and miscellaneous data available through marketing programs.

Price estimates represent average returns to growers for all uses and for all methods of sale. These prices are applied to total production to compute value of production and to the quantity sold to compute value of sales. Some unsold potatoes contribute to the value of production; including farm use for seed, feed, home use, and loss. The United States season average price is obtained by weighting State prices by quantities sold.

Potato production, utilization, and value of sales in each State have been classified by seasonal group according to the period when the largest supplies are usually harvested.

The four seasonal groups are as follows:

Season	Usual Time of Harvest
Winter	January through March
Spring	April through June
Summer	July through September
Fall	September through November

Crop year is associated with the calendar year in which harvest is accomplished. Seasons are not fixed dates but are approximations because there is some overlapping of harvest before or after the specified season. Generally, the marketing season closely follows the harvesting season except for the fall crop where marketing from storage may extend through July of the following year. Thus, the marketing year for fall potatoes is generally the start of harvest through July of the following year.

## **Record High Potato Production; Value Lowest Since 1987**

Total 1991 potato production in the U.S. was estimated at 418 million cwt, 4 percent above a year earlier and 13 percent above 1989. Harvested area, at 1.37 million acres, was up slightly and yields averaging 304 cwt per acre jumped 11 cwt. Yield per acre and production were both record highs.

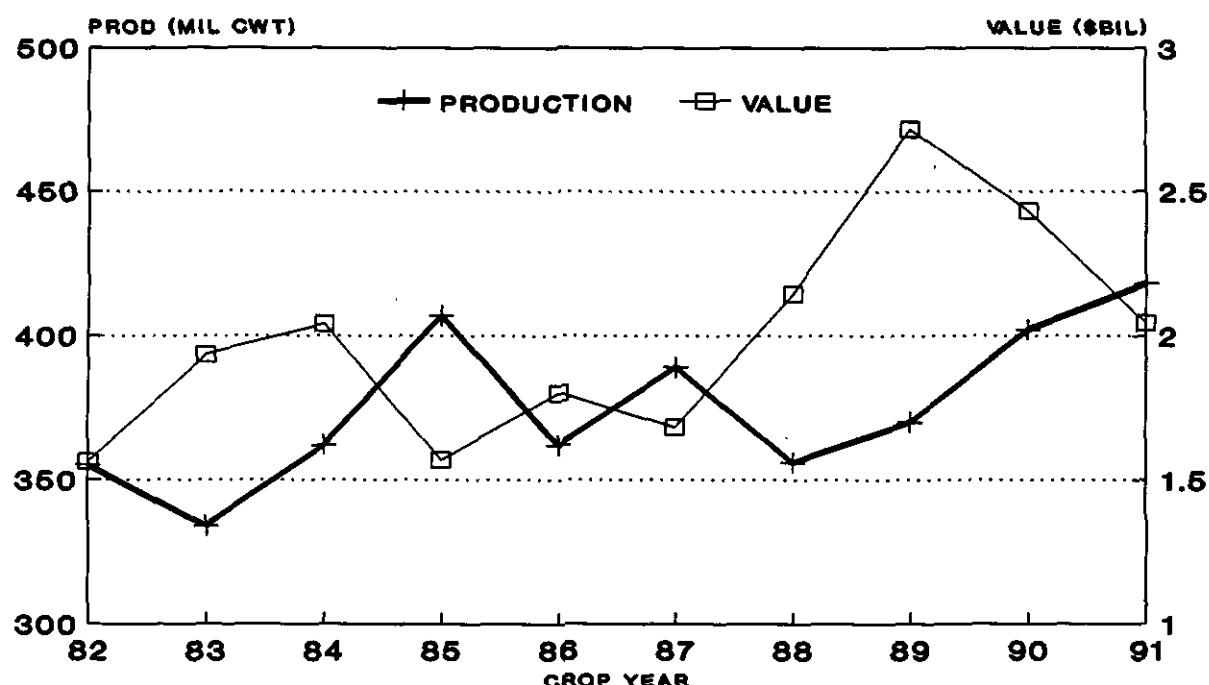

Value of production was estimated at \$2.04 billion from the 1991 crop, 16 percent less than a year earlier and 25 percent below the record high value generated in 1989. The average price was \$4.96 per cwt compared with \$6.08 from the 1990 potato crop.

Sales from the 1991 potato crop totaled 379 million cwt, up 3 percent from 1990 and 12 percent above 1989. Non-sales accounted for 38.4 million cwt of 1991 potatoes, up 12 percent from the previous year and 25 percent greater than 1989. Typically, 91 percent of potatoes produced are sold (based on the past 5-year average). The other 9 percent are either lost (shrinkage and loss) or used for seed, home use, and livestock feed on farms where grown. In the 1991 season, farmers sold 91 percent of their crop. Shrinkage and loss were estimated at 32.4 million cwt, 14 percent greater than the previous season and 30 percent above 1989. Livestock feed and home use totaled 987,000 cwt, up 8 percent. Growers kept 5.01 million cwt of potatoes for seed on their own farms, down 1 percent from the previous year.

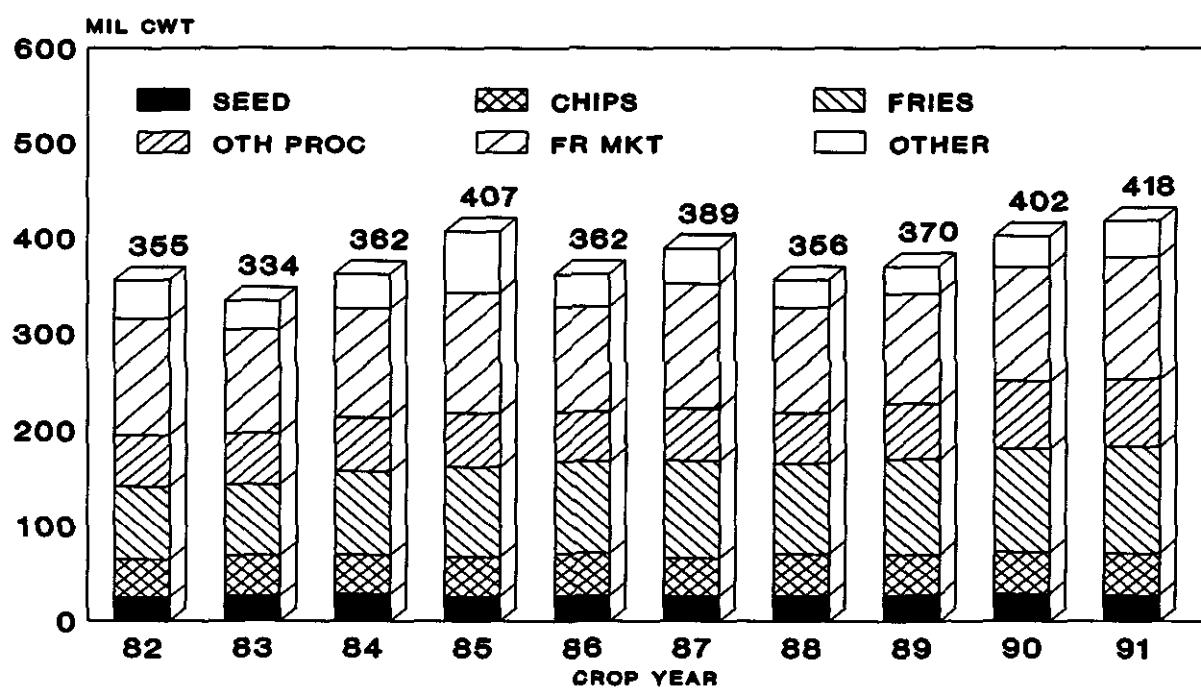

Processors used a record high 226 million cwt of potatoes, up 2 percent from 1990 and 12 percent above the 1989 usage. Table stock totaled 128 million cwt, a gain of 7 percent from last year, while other sales (seed and livestock feed) of 25.4 million cwt were down 3 percent.

Chip potato use, at 45.0 million cwt, was up 1 percent from a year earlier. Freezing potatoes totaling more than 133 million cwt (111 million cwt for fries and 22.3 for other frozen products) gained 1 percent, while dehydrating claimed 40.9 million cwt, an increase of 5 percent. Canning use totaled 4.67 million cwt, up 1 percent. Starch, flour, and other products were made from 1.74 million cwt of potatoes, a gain of 2 percent.
