# Potatoes

## 1992 Summary

September 1993  
Pot 6 (93)

## Potatoes

This publication presents final 1992 estimates of acreage, yield per acre, production, farm disposition, season average price, value, and utilization of sales including processing with historic comparisons. First of the month (December through May) stocks of potatoes for the 15 major fall producing States are also included. Production, disposition, and value data for Alaska are shown separately.

These final estimates are based on information furnished by crop reporters, processors, and cooperating State or Federal Agencies. The various sources include: Market News Service rail and truck shipments and unloads, Federal-State inspections--and miscellaneous data available through marketing programs.

Price estimates represent average returns to growers for all uses and for all methods of sale. These prices are applied to total production to compute value of production and to the quantity sold to compute value of sales. Some unsold potatoes contribute to the value of production; including farm use for seed, feed, home use, and loss. The United States season average price is obtained by weighting State prices by quantities sold.

Potato production, utilization, and value of sales in each State have been classified by seasonal group according to the period when the largest supplies are usually harvested.

The four seasonal groups are as follows:

<b>Season</b>	<b>Usual Time of Harvest</b>
Winter	January through March
Spring	April through June
Summer	July through September
Fall	September through November

Crop year is associated with the calendar year in which harvest is accomplished. Seasons are not fixed dates but are approximations because there is some overlapping of harvest before or after the specified season. Generally, the marketing season closely follows the harvesting season except for the fall crop where marketing from storage may extend through July of the following year. Thus, the marketing year for fall potatoes is generally the start of harvest through July of the following year.

## Record High Potato Production; Value Gains 14 Percent

Total 1992 potato production in the U.S. is estimated at 425 million cwt, 2 percent above a year earlier and 6 percent above 1990. Harvested area, at 1.32 million acres, was down 4 percent from previous year. Yields averaging 323 cwt per acre jumped 19 cwt. Yield per acre and production are both record high.

Value of production was estimated at \$2.34 billion from the 1992 crop, 14 percent more than a year earlier but 4 percent below 1990. The average price was \$5.52 per cwt compared with \$4.96 from the 1991 potato crop.

Sales from the 1992 potato crop totalled 386 million cwt, up 2 percent from 1991 and 5 percent above 1990. Non-sales accounted for 39.7 million cwt of 1992 potatoes, up 3 percent from the previous year and 16 percent greater than 1990. In the 1992 season, farmers sold 90.7 percent of their crop and kept 9.3 percent. Shrinkage and loss were estimated at 33.8 million cwt, 4 percent greater than the previous season and 19 percent above 1990 losses. Livestock feed and home use totalled 1.18 million cwt, up 17 percent. Growers kept 4.75 million cwt for seed on their own farms, down 6 percent from the previous year.

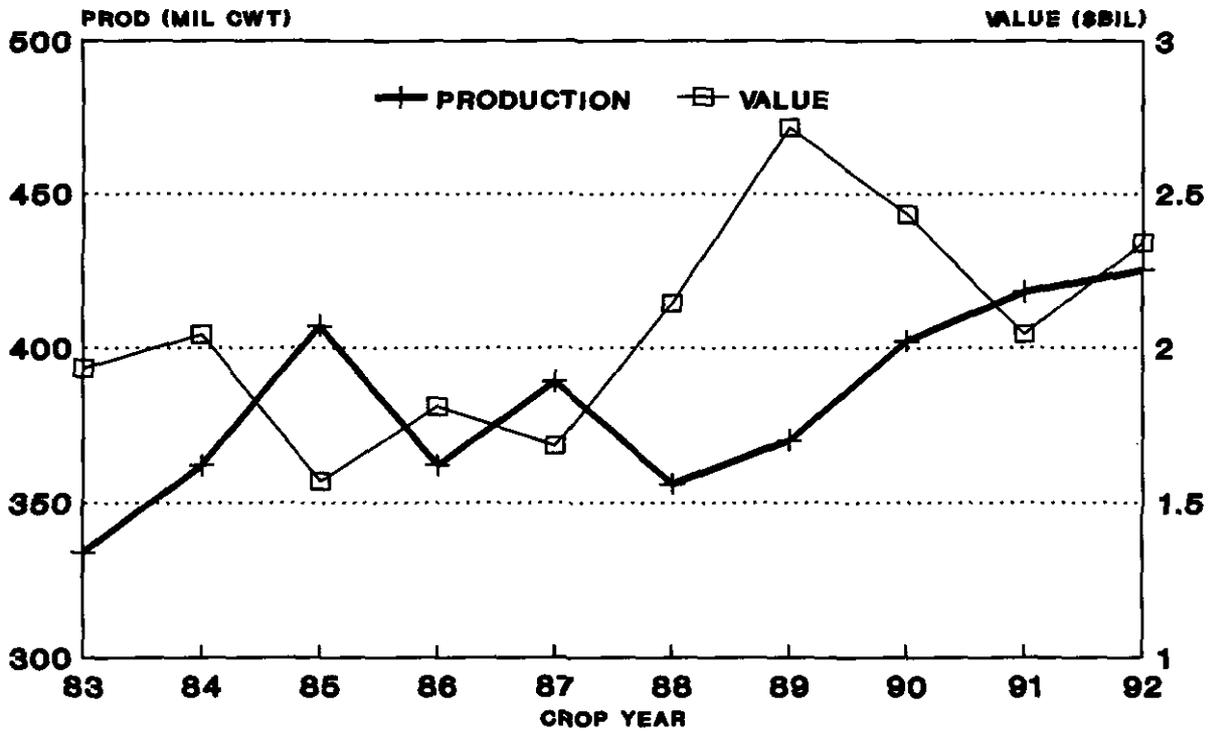

Processors used a record high 229 million cwt of potatoes, up 1 percent from 1991 and 3 percent above the 1990 usage. Table stock totalled 127 million cwt, a fractional gain from last year, while other sales (diversion, seed, and livestock feed) of 29.4 million cwt were up 14 percent.

Chip potato use, at 48.5 million cwt, was up 6 percent from a year earlier. Freezing potatoes totalling 136 million cwt gained 1 percent, while dehydrating claimed 38.1 million cwt, a decrease of 6 percent. Canning use totalled 5.27 million cwt, up 21 percent. Starch, flour and other products were made from 1.61 million cwt of potatoes, a drop of 7 percent. A diversion program purchased slightly over 2 million cwt of potatoes, mostly out of Maine.

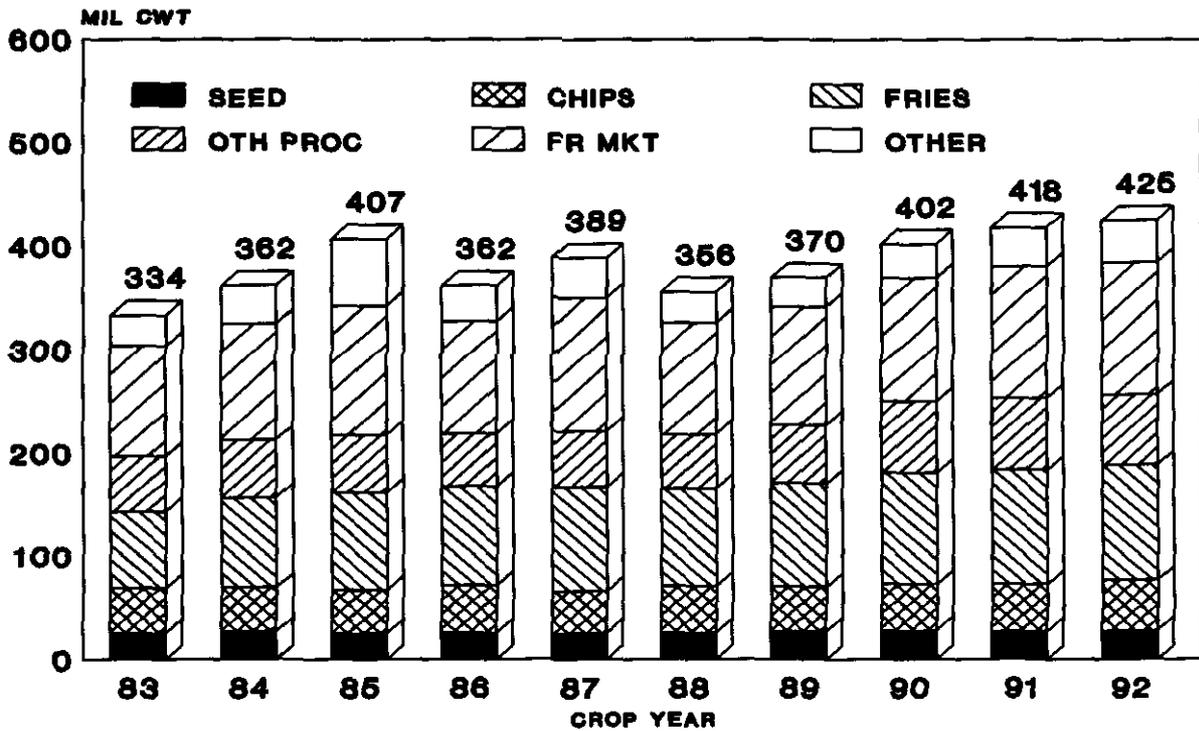

Weather conditions for the winter and spring crops were ideal in the southeast and the west. Florida, North Carolina, and California produced heavily on their acreage. Texas was too wet for potatoes and yields were down from the previous year. The East Coast produced well as cool weather helped ease the need for moisture. Favorable growing conditions across the Mid-West produced record high summer yields in Illinois, Michigan, Minnesota, and Missouri. Hot weather in California reduced yields.

Weather in the fall States was good enough to produce record high yields for the U. S. and majority of the States. Acreage cutbacks left only the best land in production. Planting started on time or earlier in most States giving potatoes a good start. Summer weather was warm with adequate moisture and irrigation supplies. Most vine growth remained ahead of schedule throughout the season. Harvest weather was ideal in most areas. Heavy rains in the North East produced rapid growth but drowned some fields in New York. Maine received a period of hot weather late in the harvest period that caused storages to overheat and many lots of potatoes were lost. Out West, hot early summer temperatures pushed growth and adequate irrigation water produced bumper crops.

### U. S. POTATO PRODUCTION AND VALUE

### U. S. POTATO UTILIZATION

Potatoes: Utilization of Crops, United States, 1989-92
