## National Verticillium Wilt Trial

## Shelley Jansky and Andy Hamernik USDA-ARS and UW-Madison Department of Horticulture

This trial is carried out annually at the Hancock Agricultural Experiment Station on a field that has been inoculated with Verticillium dahliae. Breeders are asked to submit selections from their breeding programs. Typically, these are advanced lines that may be released as cultivars. Information about Verticillium wilt (VW) resistance is useful when considering the merits of a line as a potential cultivar.

Three plots were planted on May 2, 2016. Each consisted of three replications of five-hill units of 52 cultivars and advanced selections from the U.S. potato breeding programs. Trial A was planted on a fumigated field and was used to score for vine maturity of all clones and evaluate yield of eight cultivars standards. Trial B was planted on a field that was inoculated with $V$. dahliae at planting this year. This field was used to evaluate disease symptom expression, yield in the presence of $V$. dahliae, and colonization of dying stems. Trial C was also planted on the inoculated field and was destructively sampled during the summer to evaluate colonization of green stems.

On July 28 and August 17, plots in Trial B were scored for percent foliage expressing Verticillium wilt symptoms (symp1 and symp2, respectively). On August 9, stems from all clones in Plot C were collected, surface disinfested, and squeezed in a vice to collect sap for plating. For each plot, 100 ul of sap was plated on selective medium and the plates were incubated in the dark for two weeks. After that, they were microscopically examined to determine the number of colony forming units (sap). Vines were killed on August 29; on September 6, stems were collected from clones in the Trial B field and allowed to air dry at room temperature. Stems were not collected from clones that had high levels of $V$. dahliae in stem sap. All main stems from a plot were ground in a Wiley mill and 50 mg per plot was plated on selective medium. Colonies were counted two weeks later (dry). Data are presented in Table 1.

Table 1. Performance of clones in the Verticillium wilt trial.

| Clone | Year in trial | Rep | Symp1 | Symp2 | Sap | Dry |
